SOWMYA JOY SANTHIYA.S

1. Project Overview

EventForce Management System is a Salesforce-based application designed to manage event operations in a centralized CRM environment. It connects event information with clients, vendors, venues and feedback.

Main objectives

- Centralize event-related data in Salesforce.
- Reduce manual coordination and repetitive work.
- Improve data quality through validation and formula fields.
- Automate reminders, notifications and approval activities.
- Provide operational visibility through reports and dashboards.

Overall system flow

Planning	Event + Stakeholders	Automation	Approval	Analytics
----------	----------------------	------------	----------	-----------

2. Salesforce Application Setup

Step 1 — Configure the Salesforce application.

- Open Salesforce and use the project org.
- Create/configure the EventForce Management System Lightning application.
- Add Event, Client, Vendor, Venue, Feedback and Event Vendor tabs.
- Arrange navigation items so users can access the modules quickly.

Recommended navigation

Events	Clients	Vendors	Venues	Feedback	Reports	Dashboards
--------	---------	---------	--------	----------	---------	------------

3. Custom Objects

Step 2 — Create the core custom objects required for event management.

Object	Purpose	Example data
Event	Stores event information	Name, Date, Status, Budget
Client	Stores client information	Name, Phone, Email
Vendor	Stores vendor/service information	Name, Category, Cost
Venue	Stores venue information	Name, Location, Capacity
Feedback	Captures post-event feedback	Rating, Comments
Event Vendor	Junction object	Event, Vendor, Service, Cost

Build order: create the object → add fields → configure relationships → create tab → add to the application navigation.

4. Relationship Modeling

Step 3 — Connect records using Lookup and Master-Detail relationships. Event Vendor is the junction object that implements the Event ↔ Vendor many-to-many relationship.

Relationship model

Client → Event	Event → Venue	Event ↔ Vendor via Event Vendor	Event → Feedback
----------------	---------------	------------------------------------	------------------

- Lookup relationships provide flexible associations between records.
- Master-Detail relationships create a stronger parent-child dependency.
- Two parent relationships on Event Vendor allow many events to use many vendors.

5. Fields, Formula Fields & Validation

Step 4 — Configure business fields and rules.

Validation Rules

- Prevent invalid event dates.
- Prevent negative or invalid budget/cost values.
- Ensure required business information is available before status changes.

Formula Fields

- Calculate derived values such as event duration or budget-related figures.
- Reduce manual calculations and keep derived values consistent.

Example calculation logic

Calculation	Purpose
Remaining Budget	Approved Budget – Total Cost
Event Duration	End Date – Start Date
Total Cost	Related event costs based on the project data design

6. Salesforce Flow Automation

Step 5 — Automate repetitive event-management processes with Salesforce Flow.

- Event reminder Flow — sends reminders for upcoming events.
- Feedback notification Flow — notifies responsible users when feedback is submitted.
- Approval update automation — updates/alerts users when approval status changes.
- Use Decision elements to check conditions and Update/Create Records actions to perform business changes.

Typical Flow structure

Trigger	Get / Check Data	Decision	Update / Create	Notification
---------	------------------	----------	-----------------	--------------

Testing tip: test both the condition being met and the condition not being met so the Flow does not create unintended updates.

7. Approval Process

Step 6 — Configure an approval process for event cancellation requests.

- User submits a cancellation request.
- Salesforce routes the request to the designated approver.
- Approver reviews and chooses Approve or Reject.
- Approval actions update the event process as configured.
- Email alerts notify coordinators and clients where required.

Cancellation approval flow

Cancellation Request	Approver Review	Approve / Reject	Status Update	Email Alert
----------------------	-----------------	------------------	---------------	-------------

8. Security & Access Control

Step 7 — Configure Profiles, Roles and Permission Sets.

- Profiles provide baseline object and system permissions.
- Roles support organizational record visibility.
- Permission Sets provide additional access without creating unnecessary profiles.
- Configure access according to each user's responsibilities.

Role	Typical responsibility
Coordinator	Create/update operational event records
Manager	Review approvals and monitor reports
Viewer	Read relevant records and reports

9. Reports

Step 8 — Create reports for operational monitoring.

- Upcoming Events by Month — shows the distribution of upcoming events.
- Event Summary — provides a consolidated view of event records.
- Vendor Performance — supports vendor-related operational analysis.
- Feedback Report — summarizes post-event feedback.

10. EventForce Operations Dashboard

Step 9 — Create the dashboard in the EventForce Management System application.

- Open the Dashboards tab.
- Create EventForce Operations Dashboard.
- Add dashboard components using the report sources available in the Salesforce org.
- Use the Upcoming Events by Month report for the upcoming-events overview.
- Configure the chart/component display and save the dashboard.
- Verify that dashboard values match the underlying report.

Dashboard concept

Upcoming Events	Event Summary	Vendor Performance	Feedback Insights
-----------------	---------------	--------------------	-------------------

11. End-to-End Business Process

EventForce process

Create Client / Venue	Create Event	Assign Vendors	Validate + Automate	Approval if needed	Feedback	Reports + Dashboard
-----------------------	--------------	----------------	---------------------	--------------------	----------	---------------------

- The process starts with master data such as Client, Vendor and Venue.
- An Event is created and connected to the relevant records.
- Vendors are assigned through Event Vendor.
- Rules and Flow automation keep the process controlled.
- Cancellation requests follow the approval process.
- Feedback and reporting complete the event lifecycle.

12. Testing Checklist

Step 10 — Validate every major Salesforce feature before demonstration.

Area	Expected result
Objects & Fields	Records save with correct required information.
Relationships	Related records appear correctly.
Validation Rules	Invalid data is blocked with a clear error.
Flow	Automation runs under intended conditions.
Approval	Request reaches the correct approver and status changes correctly.
Security	Users have only the intended access.
Reports	Report results match source records.
Dashboard	Components show expected operational information.

13. Key Features

- Custom Salesforce objects for complete event data management.
- Lookup, Master-Detail and junction-object relationship modeling.
- Flow automation for reminders and notifications.
- Validation Rules and Formula Fields for data quality and calculations.
- Approval Process for event cancellation requests.
- Profiles, Roles and Permission Sets for access control.
- Reports and Dashboards for operational visibility.

14. Viva / Interview Explanation

“EventForce Management System is a Salesforce-based event management application. I created custom objects for Event, Client, Vendor, Venue, Feedback and Event Vendor. I used Lookup and Master-Detail relationships and a junction object for the many-to-many Event-Vendor relationship. I used Salesforce Flow for reminders and notifications, Validation Rules and Formula Fields for data accuracy, and an Approval Process for event cancellation. Finally, Reports and the EventForce Operations Dashboard provide operational insights.”

15. Conclusion

EventForce shows how Salesforce declarative capabilities can be combined to build a practical event-management solution. The project integrates data modeling, automation, approvals, security and analytics into one connected workflow.
